

A. Test this UI mock-up, can you find any problems with this screen? (Please pay attention to all functional aspects such as Security, Usability, Performance, etc.).

After reviewing the payment form, I noticed a few issues and some things that I would like to test further.

1. Missing currency: The payment amount is shown as 30.00, but it doesn't say whether it's USD, EUR, or another currency. This could confuse users.
2. No CVV field: There is no security code field. I would check whether the payment provider requires it and how card verification is handled.
3. Card number validation: The form asks users to enter the card number without spaces or dashes. I would test what happens if someone enters letters, an incorrect number, or spaces.
4. Expiration date: I would check if the form allows users to select an expired card or a date in the past.
5. International addresses: The State or Province field might be a problem for users outside the US, especially if the list only contains US states.
6. Required fields: Some fields have a red star, but I would check whether clear error messages appear when users leave them empty.
7. Security: Since the form collects credit card information, I would verify that HTTPS is used and that card details are not stored or exposed in logs.
8. Duplicate payments: I would check what happens if a user clicks Continue several times quickly, to make sure the payment isn't processed more than once.
9. Performance: I would test how long the form takes to respond after clicking Continue, especially when the internet connection is slow.

B. Can you write 2–3 sample test cases for this functionality?

Test Case	Steps	Expected Result
TC01 – Valid card details	Fill in all required fields with valid test data and click Continue.	The form accepts the information and moves to the next step.
TC02 – Invalid card number	Enter an invalid card number, complete the other required fields, and click Continue.	An error message appears and the user cannot continue.
TC03 – Expired card	Select an expiration date in the past, fill in the remaining fields, and click Continue.	The form rejects the expired card and asks the user to choose a valid date.

C. Can you suggest a product solution for the most severe bug you've found?

I think the most serious potential issue is the security of credit card information.
The form collects sensitive payment details, so it's important to make sure this information is handled safely.
I would suggest integrating a trusted, PCI-compliant payment provider, such as Stripe or Adyen, depending on the company's location and business requirements.
By using secure payment fields, the company can avoid handling raw credit card information directly.
I would also make sure the payment page uses HTTPS and that sensitive card information is not saved in application logs.
This would reduce security risks and make the payment process safer for customers.
